

Brain Injury and Substance Use Disorder

Brain Injury can be both a cause of Substance Use Disorder and a consequence. Some people with Brain Injuries turn to substances to help with chronic pain, mental health issues (like anxiety and depression) and in an effort to “just feel normal.”

50%

About half of the people in Substance Use Disorder (SUD) treatment have a brain injury

75%

About 75% of people who need both Mental Health and SUD treatment also have a brain injury

70-80%

The percentage of people discharged from healthcare facilities for Brain Injury that are given a prescription for opioids

10-20%

Within one year after injury, 10-20% will develop a SUD problem & that number will grow over time.

For every overdose death, there are approximately fifty overdose survivors, 90% of whom become impaired because of insufficient oxygen to the brain.

BEST PRACTICE

Substance Use treatment centers should:

- **SCREEN** for prior history of Brain Injury
- **ASSESS** Cognitive & Functional Impairment
- **EDUCATE** staff on Brain Injury
- **EDUCATE** the person about their Brain Injury
- **PROVIDE** and **TEACH** Accommodations
- **CONNECT** person served with Community Resources

COMMON PROBLEMS

After Brain Injury, we often see problems with:

- Attention, memory and new learning
- Slowed speed of processing
- Organization, problem solving & impulsivity
- Irritability, frustration & agitation
- Balance, dizziness & headaches
- Poor awareness of deficits & difficulties
- Difficulty being flexible, poor self-monitoring

WHAT TO LOOK FOR

Substance Use personnel may see:

- Appearance of “checking out” during a session or group
- Appearance of defiance because they cannot remember the rules
- Slow to follow directions because they cannot process quickly
- Getting into fights because of irritability, anger and impulsivity
- Falling into things, often getting hurt
- Difficulty staying sober because of cognitive changes
- Gets stuck on an idea or a way of doing something, does not recognize mistakes

People with Brain Injury are 10 times more likely to die of accidental overdose, in large part because of cognitive and behavioral changes. 25% of people entering Brain Injury treatment were intoxicated when injured. Being intoxicated at injury makes it harder for the brain to heal.

Common Accommodations for Brain Injury Challenges

Here are some common and simple accommodations:

- Working for shorter periods of time
- Getting rid of distractions around you, like noise or movement
- Taking notes (on paper, in a notebook, on a phone or computer)
- Using a phone to set timers to remember appointments
- Repeating information to the person
- Slowing down when talking; giving them more time to respond
- Giving the person a list of house rules, written directions, or pictures to help them understand and remember
- Coaching the person with the injury to "Stop, think and plan" then act
- Coaching the person to take deep breaths when feeling angry or anxious

Tools for Best Practice

Brain Injury Screening Resources:

- **NASHIA's OBISSS:** <https://www.nashia.org/obissprogram> – The OBISSS is highly recommended. It is made up of the OSU screening tool, a Symptoms Questionnaire and Strategies. It can be used electronically, on a computer, phone or ipad. It can be self-administered.
- **OSU TBI Identification Method:** <https://wexnermedical.osu.edu/neurological-institute/neuroscience-research-institute/research-centers/ohio-valley-center-for-brain-injury-prevention-and-rehabilitation/osu-tbi-id>
